

New Fingerprint Identification Software for Small to Mid-sized Businesses is Easy to Use

The PersonID fingerprint identification system from 360 Biometrics is accurate and cost-effective

The new PersonID fingerprint identification system from 360 Biometrics (www.360Biometrics.com) is the easiest-to-use software of its kind. PersonID meets the needs of small to medium-sized businesses for an accurate, cost-effective, and adaptable fingerprint identification system.

PersonID allows organizations to easily and quickly identify employees, partners and customers, minimizing losses from fraud and creating a more secure environment.

Easy, Adaptable Process

People are enrolled in the system by capturing their fingerprints, along with any relevant identifying data and a photograph, if desired. The fingerprint is given a quality rating, helping assure that good prints are captured. User-defined, custom fields allow organizations to specify the identifying information they want to capture, letting them adapt the software to their needs. If desired, a photo of the enrolled person can be uploaded.

When a person needs to be identified, the software instantly matches the captured fingerprint against the enrolled fingerprints. The results are displayed with a match score, along with any other identifying information (including the photo if any). The software can search for a person not just by fingerprints, but by any of the identifying data (such as gender or name). The easy-to-navigate interface reduces the need to contact tech support or refer to the manual.

PersonID can be integrated into a wide variety of applications, such as transaction, authorization, point-of-sale time-and-attendance, and physical-access-control systems. Fingerprint identification is appropriate for a variety of industries including public safety, healthcare and workforce management.

The University of California San Francisco (UCSF), for example, is using the fingerprint identification system for a health survey in Ghana. "We chose PersonID because it is so easy to

use and we could adapt it to meet our precise needs," said Ellen Stein, UCSF academic coordinator.

Award-winning Technology

PersonID was created using Griaule's Fingerprint SDK, which won the prestigious Fingerprint Verification Competition in the Equal Error Rate (EER) category. "SC Magazine" gave the PersonID fingerprint identification software four stars overall (out of five), with five stars for its ease of use and documentation (<http://www.scmagazineus.com/360-biometrics-personid/review/3383/>).

PersonID works with a variety of fingerprint readers, including Hamster IV (an FBI certified fingerprint reader), Hamster Plus, OptiMouse Plus, Verifier 300, and Venus Multispectral.

The fingerprint identification software also supports popular operating systems, including Windows 7, Windows XP, Windows Server 2003 and Windows 2000.

Pricing and Availability

PersonID is available now in a stand-alone (small business), client-server (small businesses to enterprise) or Web-based (small businesses to enterprises) versions. Information captured by one version is accessible by the other versions as organizations upgrade. At an average cost of less than a dollar per enrolled person, PersonID is the most cost-effective fingerprint identification software available today.

About 360 Biometrics

360 Biometrics provides a full spectrum of high-tech biometric identity and security solutions, including software, hardware and consulting for fingerprint, face and signature recognition. The firm is also an established integrator and value-added reseller of multiple biometric technologies and products. 360 Biometrics serves a broad customer base that includes small businesses, large commercial enterprises and government organizations, both within the United States and internationally. For more information on the privately held, San Jose, Calif.-based company, visit the website at www.360biometrics.com, e-mail info@360biometrics.com or call 408-850-8116.
